CS 6375
Machine Learning
(Qualifying Exam Section)

Nicholas Ruozzi

University of Texas at Dallas

Slides adapted from David Sontag and Vibhav Gogate

Course Info.

- Instructor: Nicholas Ruozzi

  - Office: ECSS 2.305

  - Office hours: Mon. 1pm-2pm

- TA: ?

  - Office hours and location ?

- Course website: www.utdallas.edu/~nrr150130/cs6375/2018fa/

- Piazza (online forum): sign-up link on eLearning

Prequisites

- CS 5343 (data structures & algorithms)

- "Mathematical sophistication"

  - Basic probability

  - Linear algebra

    - Eigenvalues, eigenvectors, matrices, vectors, etc.

  - Multivariate calculus

    - Derivatives, gradients, convex functions, etc.

- I'll review some concepts as we come to them, but you should brush up in areas that you aren't as comfortable

Grading

- 5-6 problem sets (50%)

  - See collaboration policy on the web

  - Mix of theory and programming (in MATLAB or Python)

  - Available and turned in on eLearning

  - Approximately one assignment every two weeks

- Midterm Exam (20%)

- Final Exam (30%)

-subject to change-

Course Topics

- Dimensionality reduction
    - PCA
    - Matrix Factorizations
- Learning
    - Supervised, unsupervised, active, reinforcement, …
    - Learning theory: PAC learning, VC dimension
    - SVMs & kernel methods
    - Decision trees, k-NN, logistic regression, …
    - Parameter estimation: Bayesian methods, MAP estimation, maximum likelihood estimation, expectation maximization, …
    - Clustering: k-means & spectral clustering
- Probabilistic models
    - Bayesian networks
    - Naïve Bayes
- Neural networks
- Statistical methods
    - Boosting, bagging, bootstrapping
    - Sampling
- Ranking & Collaborative Filtering

What is ML?

What is ML?

"A computer program is said to learn from experience E with respect to some task T and some performance measure P, if its performance on T, as measured by P, improves with experience E."

- Tom Mitchell

Basic Machine Learning Paradigm

- Collect data

- Build a model using "training" data

- Use model to make predictions

Supervised Learning

- **Input:** $(x^{(1)}, y^{(1)}), \ldots, (x^{(M)}, y^{(M)})$

  - $x^{(m)}$ is the mth data item and $y^{(m)}$ is the mth **label**

- **Goal:** find a function f such that $f\left(x^{(m)}\right)$ is a "good approximation" to $y^{(m)}$

  - Can use it to predict y values for previously unseen x values

Examples of Supervised Learning

- Spam email detection

- Handwritten digit recognition

- Stock market prediction

- More?

Supervised Learning

- Hypothesis space: set of allowable functions $f : X \rightarrow Y$

- Goal: find the "best" element of the hypothesis space

  - How do we measure the quality of f?

Supervised Learning

- Simple linear regression

  - Input: pairs of points $\left(x^{(1)}, y^{(1)}\right), \ldots, (x^{(M)}, y^{(M)})$ with $x^{(m)} \in \mathbb{R}$ and $y^{(m)} \in \mathbb{R}$

  - Hypothesis space: set of linear functions $f(x) = ax + b$ with $a, b \in \mathbb{R}$

  - Error metric: squared difference between the predicted value and the actual value

Regression
Regression
Hypothesis class: linear functions $f(x) = ax + b$

How do we compute the error of a specific hypothesis?

Linear Regression

- For any data point, x, the learning algorithm predicts $f(x)$

- In typical regression applications, measure the fit using a squared loss function

$$L(f) = \frac{1}{M} \sum_{m} \left(f\left(x^{(m)}\right) - y^{(m)} \right)^2$$

- Want to minimize the average loss on the training data

- The optimal linear hypothesis is then given by

$$\min_{a,b} \frac{1}{M} \sum_{m} \left(ax^{(m)} + b - y^{(m)} \right)^2$$

Linear Regression

$$\min_{a,b} \frac{1}{M} \sum_m \left(ax^{(m)} + b - y^{(m)} \right)^2$$

- How do we find the optimal a and b?

Linear Regression

$$\min_{a,b} \frac{1}{M} \sum_m \left(ax^{(m)} + b - y^{(m)} \right)^2$$

- How do we find the optimal a and b?

  - Solution 1: take derivatives and solve (there is a closed form solution!)

  - Solution 2: use gradient descent

Linear Regression

$$\min_{a,b} \frac{1}{M} \sum_m \left(ax^{(m)} + b - y^{(m)} \right)^2$$

- How do we find the optimal a and b?

  - Solution 1: take derivatives and solve (there is a closed form solution!)

  - Solution 2: use gradient descent

    - This approach is much more likely to be useful for general loss functions
Gradient Descent

Iterative method to minimize a (convex) differentiable function f

- Pick an initial point x_0

- Iterate until convergence

$$x_{t+1} = x_t - \gamma_t \nabla f(x_t)$$

where γ_t is the tth step size (sometimes called learning rate)

Gradient Descent

source: Wikipedia

Gradient Descent

$$\min_{a,b} \frac{1}{M} \sum_m \left(ax^{(m)} + b - y^{(m)} \right)^2$$

- What is the gradient of this function?

- What does a gradient descent iteration look like for this simple regression problem?

(on board)

Linear Regression

- In higher dimensions, the linear regression problem is essentially the same with $x^{(m)} \in \mathbb{R}^n$

$$\min_{a \in \mathbb{R}^n, b} \frac{1}{M} \sum_m \left(a^T x^{(m)} + b - y^{(m)} \right)^2$$

- Can still use gradient descent to minimize this

  - Not much more difficult than the $n = 1$ case

Gradient Descent

- Gradient descent converges under certain technical conditions on the function f and the step size γ_t

    - If f is convex, then any fixed point of gradient descent must correspond to a global optimum of f

    - In general, convergence is only guaranteed to a local optimum

Regression

- What if we enlarge the hypothesis class?

    - Quadratic functions

    - k-degree polynomials

- Can we always learn better with a larger hypothesis class?

Regression

- What if we enlarge the hypothesis class?

  - Quadratic functions

  - k-degree polynomials

- Can we always learn better with a larger hypothesis class?

Regression
- Larger hypothesis space always decreases the cost function, but this does NOT necessarily mean better predictive performance

  - This phenomenon is known as overfitting

  - Ideally, we would select the simplest hypothesis consistent with the observed data

- In practice, we cannot simply evaluate our learned hypothesis on the training data, we want it to perform well on unseen data (otherwise, we can just memorize the training data!)

  - Report the loss on some held out test data (i.e., data not used as part of the training process)

Binary Classification

- Regression operates over a continuous set of outcomes

- Suppose that we want to learn a function $f : X \to \{0,1\}$

- As an example:

	x_1	x_2	x_3	y
1	0	0	1	0
2	0	1	0	1
3	1	1	0	1
4	1	1	1	0

How do we pick the hypothesis space?

How do we find the best f in this space?

Binary Classification

- Regression operates over a continuous set of outcomes

- Suppose that we want to learn a function $f: X \rightarrow \{0,1\}$

- As an example:

	x_1	x_2	x_3	y
1	0	0	1	0
2	0	1	0	1
3	1	1	0	1
4	1	1	1	0

How many functions with three binary inputs and one binary output are there?

Binary Classification

	x_1	x_2	x_3	y
	0	0	0	?
1	0	0	1	0
2	0	1	0	1
	0	1	1	?
	1	0	0	?
	1	0	1	?
3	1	1	0	1
4	1	1	1	0

2^8 possible functions

2^4 are consistent with the observations

How do we choose the best one?

What if the observations are noisy?

Challenges in ML

- How to choose the right hypothesis space?

  - Number of factors influence this decision: difficulty of learning over the chosen space, how expressive the space is, ...

- How to evaluate the quality of our learned hypothesis?

  - Prefer "simpler" hypotheses (to prevent overfitting)

  - Want the outcome of learning to generalize to unseen data

Challenges in ML

- How do we find the best hypothesis?

    - This can be an NP-hard problem!

    - Need fast, scalable algorithms if they are to be applicable to real-world scenarios

Other Types of Learning

- Unsupervised
  - The training data does not include the desired output

- Semi-supervised
  - Some training data comes with the desired output

- Active learning
  - Semi-supervised learning where the algorithm can ask for the correct outputs for specifically chosen data points

- Reinforcement learning
  - The learner interacts with the world via allowable actions which change the state of the world and result in rewards
  - The learner attempts to maximize rewards through trial and error
